#### **Constraints Y**

Defining primary key and foreign key constraints on MySQL tables can significantly improve query performance.

When a primary key is defined on a table, an index is automatically created on that column. This index enables the database engine to easily locate specific rows in the table, which can greatly reduce query execution time.

Similarly, when a foreign key is defined, it establishes a relationship between two tables that can be used to join them together efficiently.

By utilizing these constraints, the database engine can avoid expensive table scans and instead use indexes to quickly retrieve the necessary data and enhance some queries performance.

```
ALTER TABLE ydocentes ADD CONSTRAINT ydocentes_pk PRIMARY KEY (nr); ALTER TABLE zdocentes ADD CONSTRAINT zdocentes pk PRIMARY KEY (nr);
```

```
ALTER TABLE yucs ADD CONSTRAINT yucs_pk PRIMARY KEY (codigo); ALTER TABLE zucs ADD CONSTRAINT zucs pk PRIMARY KEY (codigo);
```

ALTER TABLE yocorrencias ADD CONSTRAINT yocorrencias\_pk PRIMARY KEY (codigo, ano\_letivo, periodo);

ALTER TABLE yocorrencias ADD CONSTRAINT yocorrencias\_fk FOREIGN KEY(codigo) REFERENCES yucs(codigo);

ALTER TABLE zocorrencias ADD CONSTRAINT zocorrencias\_pk PRIMARY KEY (codigo, ano letivo, periodo);

ALTER TABLE zocorrencias ADD CONSTRAINT zocorrencias\_fk FOREIGN KEY(codigo) REFERENCES zucs(codigo);

ALTER TABLE ytiposaula ADD CONSTRAINT ytiposaula\_pk PRIMARY KEY(id);
ALTER TABLE ytiposaula ADD CONSTRAINT ytiposaula\_fk FOREIGN KEY (ano\_letivo, periodo, codigo) REFERENCES yocorrencias(ano\_letivo, periodo, codigo);
ALTER TABLE ztiposaula ADD CONSTRAINT ztiposaula\_pk PRIMARY KEY(id);
ALTER TABLE ztiposaula ADD CONSTRAINT ztiposaula\_fk FOREIGN KEY (ano\_letivo, periodo, codigo) REFERENCES zocorrencias(ano\_letivo, periodo, codigo);

ALTER TABLE ydsd ADD CONSTRAINT ydsd\_pk PRIMARY KEY (nr,id); ALTER TABLE ydsd ADD CONSTRAINT ydsd\_fk1 FOREIGN KEY (nr) REFERENCES ydocentes(nr);

ALTER TABLE ydsd ADD CONSTRAINT ydsd\_fk2 FOREIGN KEY (id) REFERENCES ytiposaula(id);

ALTER TABLE zdsd ADD CONSTRAINT zdsd\_pk PRIMARY KEY (nr,id);

ALTER TABLE zdsd ADD CONSTRAINT zdsd\_fk1 FOREIGN KEY (nr) REFERENCES zdocentes(nr);

ALTER TABLE zdsd ADD CONSTRAINT zdsd\_fk2 FOREIGN KEY (id) REFERENCES ztiposaula(id);

#### **Constraints Z**

Overall, we consider indexing columns that are frequently used in the WHERE clause of our queries. By indexing these columns, we can improve the performance of queries that filter rows based on those columns.

We chose to index **curso** and **designacao** on the table **zucs**, **curso** on the table **zucs**, **ano\_letivo** on the table **zocorrencias** and **ano\_letivo** on the table **ziposaula**.

```
CREATE INDEX ucs_idx ON zucs (curso, designacao);
CREATE INDEX ucs_idx_curso ON zucs (curso);
CREATE INDEX ocorrencias_idx ON zocorrencias (ano_letivo);
CREATE INDEX tiposaula_idx_anoletivo ON ztiposaula (ano_letivo);
```

## Query 1 - Show the codigo, designacao, ano\_letivo, inscritos, tipo, and turnos for the course 'Bases de Dados' of the program 275.

#### 1) the SQL query;

SELECT xucs.codigo, xucs.designacao, xocorrencias.ano\_letivo, xocorrencias.inscritos,xtiposaula.tipo,xtiposaula.turnos

**FROM** xucs

JOIN xocorrencias ON xucs.codigo=xocorrencias.codigo

JOIN xtiposaula ON xocorrencias.ano letivo=xtiposaula.ano letivo

AND xocorrencias.periodo= xtiposaula.periodo

AND xocorrencias.codigo=xtiposaula.codigo

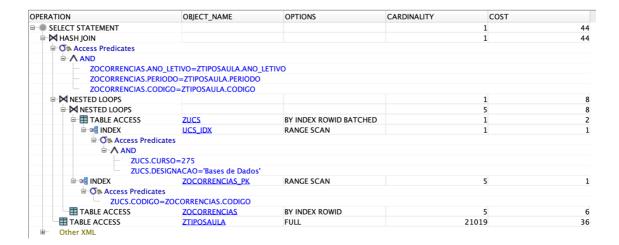

WHERE curso='275' AND designacao='Bases de Dados';

2) the answer;

∯ CODIGO		# ANO_LETIVO		<b>∯ TIPO</b>	<b>⊕</b> TURNOS
1 EIC3106	Bases de Dados	2003/2004	92	Т	1
2 EIC3106	Bases de Dados	2003/2004	92	TP	4
3 EIC3106	Bases de Dados	2004/2005	114	Т	1
4 EIC3106	Bases de Dados	2004/2005	114	TP	4
5 EIC3111	Bases de Dados	2005/2006	(null)	Т	1
6 EIC3111	Bases de Dados	2005/2006	(null)	TP	6

3) the three execution plans in the three environments, their analysis and of the corresponding estimated effort

The usage of the foreign keys codigo and ano\_letivo improved the cost of the JOIN between yocorrencias and yucs and the JOIN between yocorrencias and ytiposaula.

The usage of the index ucs\_index improved the cost of filtering the curso and designacao in environment z.

Environment	Execution Time (ms)
Environment X	78
Environment Y	37
Environment Z	34

## Query 2 - How many class hours of each type did the program 233 planned in year 2004/2005?

#### 1) the SQL query;

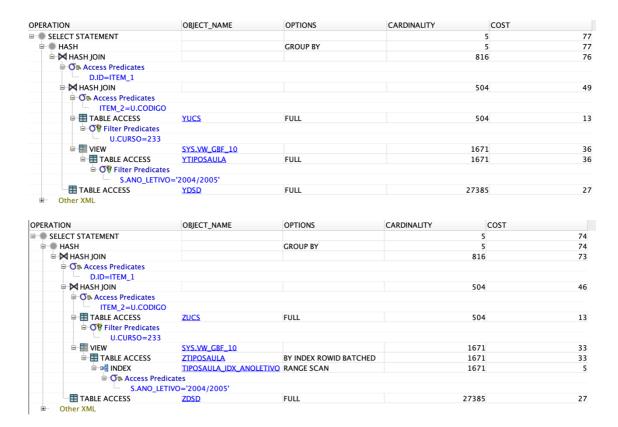

SELECT tipo, SUM(horas) as hours\_planned
FROM xtiposaula s JOIN xdsd d ON d.id=s.id
JOIN xocorrencias o ON o.codigo=s.codigo AND o.ano\_letivo=s.ano\_letivo AND
o.periodo=s.periodo
JOIN xucs u ON o.codigo=u.codigo
WHERE u.curso=233 AND o.ano\_letivo='2004/2005'
GROUP BY s.tipo;

#### 2) the answer;

	<b>∜ TIPO</b>	
1	Р	571,5
2	TP	697,5
3	Т	298

3) the three execution plans in the three environments, their analysis and of the corresponding estimated effort;

OPERATION	OBJECT_NAME	OPTIONS	CARDINALITY	COST
<b>■</b> ■ SELECT STATEMENT			5	67
⊨ • HASH		GROUP BY	5	67
⊨ M HASH JOIN			894	66
□ O      ■ Access Predicates     □

TABLE ACCESS	XDSD	FULL	27385	2

The usage of the foreign keys codigo, ano\_letivo and period improved the cost of the JOIN between yocorrencias and ytiposaula.

The usage of the index tiposaula\_idx\_anoletivo improved the cost of filtering the ano\_letivo in environment z.

Environment	Execution Time (ms)
Environment X	41
Environment Y	30
Environment Z	27

# Query 3 - Which courses (show the code) did have occurrences planned but did not get service assigned in year 2003/2004? a. Use not in.

#### 1) the SQL query;

SELECT o.codigo, o.periodo
FROM xocorrencias o
WHERE o.ano\_letivo='2003/2004'
AND (o.codigo, o.periodo) NOT IN
(SELECT t.codigo, t.periodo FROM xtiposaula t WHERE t.ano\_letivo='2003/2004');

#### 2) the answer;

	<b>⊕</b> CODIGO	<b>♦ PERIODO</b>		<b>⊕</b> PERIODO			<b>♦ PERIODO</b>

There is no improvement from environment x to y. This is due to usage of a GROUP BY function with 4 different columns, which makes it very difficult to use correct indexes that could improve the performance.

Between environment y to z, the index tiposaula\_idx\_anoletivo reduces the cost when creating the VIEW because we are filtering from ano\_letivo column.

Environment	Execution Time (ms)
Environment X	100
Environment Y	98
Environment Z	89

- Query 5 Compare the execution plans (just the environment Z) and the index sizes for the query giving the course code, the academic year, the period, and number of hours of the type 'OT' in the academic years of 2002/2003 and 2003/2004.
- a. With a B-tree index on the type and academic year columns of the ZTIPOSAULA table;
- b. With a bitmap index on the type and academic year columns of the ZTIPOSAULA table.

```
1) the SQL query;
a.

CREATE INDEX tiposaula_idx ON ztiposaula (tipo, ano_letivo);

SELECT u.sigla_uc, o.ano_letivo, o.periodo, s.horas_turno
FROM ztiposaula s JOIN zocorrencias o ON o.codigo=s.codigo AND
o.ano_letivo=s.ano_letivo AND o.periodo=s.periodo
JOIN zucs u ON u.codigo = o.codigo
WHERE s.tipo='OT' AND s.ano_letivo LIKE '%2003%';
b.
DROP INDEX tiposaula_idx;
CREATE BITMAP INDEX tiposaula_idx ON ztiposaula (tipo, ano_letivo);

SELECT u.sigla_uc, o.ano_letivo, o.periodo, s.horas_turno
FROM ztiposaula s JOIN zocorrencias o ON o.codigo=s.codigo AND
o.ano_letivo=s.ano_letivo AND o.periodo=s.periodo
JOIN zucs u ON u.codigo = o.codigo
WHERE s.tipo='OT' AND s.ano_letivo LIKE '%2003%';
```

#### 2) the answer;

	₱ SIGLA_UC	# ANO_LETIVO	<b>⊕</b> PERIODO	⊕ HORAS_TURNO
1	EC	2002/2003	2S	0,5
2	EC	2003/2004	2S	0,5

3) the three execution plans in the three environments, their analysis and of the corresponding estimated effort;

a.

OPERATION	OBJECT_NAME	OPTIONS	CARDINALITY	COST
<b>■</b> ■ SELECT STATEMENT			10	0 13
ф- <b>М</b> HASH JOIN			10	0 13
U.CODIGO=S.CODIGO				
■ M NESTED LOOPS			10	0 13
			10	0 13
□ STATISTICS COLLECTOR				
□ ■ TABLE ACCESS	ZTIPOSAULA	BY INDEX ROWID BATCHED	10	)
i index	TIPOSAULA_IDX	RANGE SCAN	10	) 2
□ O™ Access Predica	tes			
S.TIPO='OT'				
□ 🗗 🗗 Filter Predicate	S			
S.ANO_LETIV	O LIKE '%2003%'			
□ □ □ INDEX	ZUCS_PK	UNIQUE SCAN		1 (
☐ On Access Predicates				
U.CODIGO=S.CODI	GO			
TABLE ACCESS	ZUCS	BY INDEX ROWID	:	1
TABLE ACCESS	ZUCS	FULL		1 3

b.

Bitmap indexes work best when the indexed columns have high cardinality, i.e., when the number of distinct values is large compared to the total number of rows in the table. That is not the case in this situation, since the cardinality is 10. For that reason, the B-tree index has a lower cost when comparing with the Bitmap index.

Environment	Execution Time (ms)
Environment Z_A	48
Environment Z_B	140

## Query 6 - Select the programs (curso) that have classes with all the existing types.

#### 1) the SQL query;

SELECT u.curso
FROM xucs u JOIN xocorrencias o ON u.codigo = o.codigo
JOIN xtiposaula s ON o.codigo=s.codigo AND o.ano\_letivo=s.ano\_letivo AND
o.periodo=s.periodo
GROUP BY u.curso HAVING COUNT(DISTINCT s.tipo)>4;

#### 2) the answer;

3) the three execution plans in the three environments, their analysis and of the corresponding estimated effort;

The usage of the foreign keys codigo, ano\_letivo and periodo improved the cost of the JOIN between yocorrencias and ytiposaula.

There is no difference in cost between environment y and z since there is not an index that could improve the performance.

Environment	Execution Time (ms)
Environment X	91
Environment Y	62
Environment Z	62
